## SQLearn

SQLearn is a lightweight and easy to use application designed to provide you with an intuitive SQLite browser. SQLearn is pretty easy to use, you only need to open the application, run the SQLearn wizard, and connect to your SQLite database (usually using your favorite SQL editor). In a few easy steps, SQLearn will generate a SQL file that contains a schema for the selected database. Support for SQLite 3 (SQLite3 databases) is a nice improvement, as SQLearn handles most of SQLite's new features like automatic indexing, foreign keys, BLOBs, BLOBs with indexes, BLOBs with triggers, etc. The main features: - Supports the creation of a new database. - It will generate an SQL file for you with the schema of your database (or optionally, a schema of your choice). - It is pretty easy to use, you only need to open the application, run the SQLearn wizard, and connect to your SQLite database (usually using your favorite SQL editor). - Various features included by default (ex: creation of SQLite databases, etc.) - Supports databases stored in your laptop or in a local server. - The database file doesn't need to be stored on the computer the application is running. - You can choose what database to create: the default application's database or a custom SQLite database. - You can choose the target database in different formats: SQL, Psql, MySQL, Oracle, etc. - It can also be used as a SQLite query tool. - You can import your previously generated SQL files using the SQLearn Wizard. - You can export your previously generated SQL files using the SQLearn Wizard. - You can export your tables and columns of a selected SQLite database as CSV. What's new in this release: - It is now possible to generate the schema of your database instead of only the SQL file. - It is now possible to choose the type of database you want to create. - It is now possible to generate databases stored in the laptop or in a local server. - It is now possible to add foreign keys (with existing and empty primary keys). - It is now possible to add triggers. - It is now possible to choose what kind of field you want to add as primary key. - It is now possible to remove an existing database

## System Requirements For SQLearn:

There are basically 3 requirements for our game to run: You need Unity 2017.4 to be installed (not sure if this is just the editor or the game itself. You need to have the latest graphics card drivers installed. All Unity's graphics creation technology is rendered with the GPU, so we do not try to run on integrated graphics and expect to run fine, but you will get better performance if you do. Player's Experience: You will need 5 GB of RAM at the minimum, because we need to keep in memory a huge amount of graphics data.
