A telnet client written for Windows, Linux, Mac and Unix systems Waxcraft is a new media archiving product with a unique design that enables users to access and play their archives from their web browser. Waxcraft allows users to download free, high quality samples with no download limits and it also includes a free client for browsing your archive on your desktop. Beats is a free (as in beer) cross platform music player. It is my first "official" project. Beats is written entirely in C++, and is now using the Gtk+ libraries. However, this is just a port of my former project AlgoldW which was written in C++ for Borland Visual C++ 5.5, which is now Gtk+. Bix is a faster, easier to use chat room/mail reader that works under Windows as well as Linux/Unix. Bix is an open source program, and it is distributed under the GNU General Public License. I primarily designed and developed Bix myself, as a Windows application, and it became the first choice for mail client for my users in my own chat room service. While other chat and mail readers are available, Bix is definitely unique because of its speed. Humdinger is a free host-based mail redirector. Humdinger uses a server to store email messages. This enables the use of multiple clients, each accessing the message-server and send the message to a local client. Humdinger can also act as an IM server. FantasyWIP is a set of utilities to map Direct3D objects to the Ogre3D (OGRE) engine. The utility provides a simple scripting interface to quickly manipulate Ogre's model loader. It also makes it possible to build fully functioning in-game tools using OpenGL and Ogre. hulk is a cross platform console based programming toolset which allows you to build applications that run on platforms such as Windows, Linux, SunOS and Mac OS X (although at the time of writing its now only actively developed under Windows). For a long time I have been playing around with an idea of a text-based debugger for the Linux 2.2 kernel, with the idea that it might make development a bit easier, particularly for the kernel's block drivers. But first I needed some way

WixTin (is an open-source telnet client written in C++, which meets the following features: * Prints progress messages * Supports various colours * Supports tracing * Allows paging * Allows custom menus * Can run from a directory * Supports different logfiles * Optional external mails * Supports multiple windows * Supports VIM * Supports remote file listing * Supports paging * Supports history on loading * Supports multi-file listing * Supports the ability to click on remote files * Supports setting home and endpoints * Supports the ability to manage files * Supports the ability to send files and receiving files * Supports the ability to reset * Allows you to connect with multiple mss * Supports editing files * Supports sending messages * Supports vhd chat * Supports /ctcp/ _____ * Supports supporting wwi * Supports quitting * Supports settings * Supports the ability to connect with sockets * Supports the ability to send commands and receive commands * Supports vidplay and vidshow * Supports (and even showcases) gifs * Supports sending databases * Supports the ability to connect with telnets * Supports listing databases * Supports multiple databases * Supports a main menu bar * Supports the ability to change colours * Supports the ability to send messages * Allows sending commands * Supports auto-files * Supports auto-levels * Supports changes in the appearance of filenames * Supports the ability to join servers * Supports the ability to search databases * Supports the ability to change the current level * Supports multiple levels * Supports the ability to set preferred level * Supports the ability to save settings as defaults * Supports debugging * Supports the ability to send commands * Supports the ability to send files * Supports the ability to accept files * Supports playing sounds * Supports the ability to edit commands * Supports the ability to edit or change code * Supports the ability to edit a level's code * Supports the ability to edit the command list * Supports the ability to edit most code * Supports the ability to search files * Supports the ability to edit most code * Supports the ability to rename and re-order code * Supports the ability to edit most code * Supports the ability to define new commands * Supports the ability to change appearance * Supports the 09e8f5149f

3D-MUD2 is a free, Open Source 3D, multiplayer text-based MMO game (MMORPG). It is currently freeware and requires the OpenGL library. It is a platform independent MUD (Multi-User Dungeon). Unlike most MUD clients, it doesn't require your own server. If you are running GNU/Linux, Windows, or Mac OS X, you should be able to download the source code from the (3D-MUD2 Web site. Read the provided text and documentation files carefully. Some of the main features of 3D-MUD2 include support for OGL, TCP and UDP connections. TCP means the game can be run over the Internet and UDP means it can be played from the same machine where it was compiled. This eliminates the need for a dedicated server. There are many areas to be explored in 3D-MUD2, and there are many things to do in the game. You may run one character in the game as a Admin, but there are many areas where players can explore. There is a sky, ocean, and land. There is more than one interior in the game. There are many options for weapons, armor, and items. And you will gain experience and items in every area. 3D-MUD2 features OGL support for artists and programmers, easy to program, simple to use. There are wizards that help you with the code, and many tutorials and examples are provided. 3D-MUD2 is very complete and is well documented. We know you will like 3D-MUD2, and we hope you'll join us in the game, "3D-MUD2".. PsyBBS was written to allow you to run PsyBBS, an electronic bulletin board. It was also written so that non-technical users could install and run a bulletin board without having to muddle through a ream of code. PsyBBS is probably best known for running the PsyBBS mailing list, and as of this writing you may still read the daily post, but you will no longer be able to reply to new posts. This package contains the binaries for users running Windows, Linux, or DOS systems. Lua::Gtk::Center is a Perl module that allows Perl scripts to deal with GTK+ widgets. It consists of the Perl module, Gtk::Center, and a Perl API,

What's New In?

WixTin is a complete Telnet client with all features, right where you do not need to move your mouse. WixTin includes a complete TCP/IP stack with sensible defaults for all supported operating systems. This includes both client and server side. WixTin Features WixTin has these features: * Support for AIM, Bonjour, HTTP, ICQ, MSN, NNTP, SHOUTcast, TFTP, WebDAV, FTP, Gopher, GTalk, NNTP, POP, RDP, SIP, SMPP, SLS, SMTP, SSH, Telnet, Yahoo, IRC, POP3 * One click connection. Just choose your protocol from the list and connect. * File transfer * Built-in editor * Complete TCP/IP stack with sensible defaults for all supported operating systems * Game support, including Doom III, Quake III, Unreal, Worms, Unreal Tournament 2004 and Warcraft III * Run in the background with a tray icon * Themes support * Compatible with other freeware programs * All protocols are supported with Telnet, FTP, HTTP, SSH and TFTP protocols installed * Notifications support * Runs as a foreground app * Runs in all supported operating systems (Windows XP, Windows 2000, Windows 98, Windows ME, Windows 98 SE, Windows NT, Windows 2000 SE, Windows Vista, Windows 98 SE SP2, Windows 2000 SE SP2, Windows XP SP2, Windows 2000 SP2, Windows 98 SP3, Windows 2000 SP3, Windows XP SP3, Windows Vista SP1, Windows 98 SP3, Windows 2000 SP3, Windows XP SP3, Windows Vista SP2, Windows 2000 SP2, Windows XP SP2) * Supports all extended modifiers * Can be configured to only allow the default protocols, including Telnet, FTP and HTTP * Thumbnail mode included (PC Windows only) Advertisement Download WixTin Demo Like it? Share with your friends! Other Java Freeware of Developer «DAM»: TinyCamTinycam is a P2P webcam capture / streaming program. The purpose of the program is to enable you to use your webcam as a chat camera, to allow you to broadcast your webcam to the people on the network, to

System Requirements:

RAM: 4 GB OS: Windows 7 x64 or later Processor: Dual core processor Graphics: NVidia GeForce GTS 320M or ATI Radeon HD 3650 DirectX: Version 11 HDD: 150 GB Video: 1024×768 Resolution INSTRUCTIONS: How To Install: Download the game from the link below and unzip it. Run the installer and follow the instructions. The installation can take a few minutes,
