a) Product name. b) Name of the application (Try it) or product (Support it). c) Category and version of the software (compare with existing products in the same category). d) Size and/or storage capacity of the software (permanent or temporary). e) Installation size (includes pre-installation components). f) Maximum communication protocol (Ethernet or Wi-Fi). g) Quantity and type of the software (License/Registration code) and of its activations (Number of activate programs installed). h) Name and version of the installed product. i) The name and version of the device on which it is being installed. j) Screen resolution and color depth. k) Language. l) File and folder sharing and communication protocols. m) Internet connection settings. n) The date on which the product was installed (or the “date installed”) and the system on which it is being used (operating system and hardware architecture). o) The client’s name and network user identification code. p) Amount of installed temporary memory (RAM). q) The amount of temporary and disk space (HDD, SSD). Recommendation 1. The product name. When a software's name is the same as a product name, using the latter is not ideal. This will lead to misleading the customer by suggesting that the "product" is actually something else than what the customer has

purchased. 2. The name of the application (Try it) or product (Support it). When a software is released under a name that suggests that it is a commercial product, the name must be changed to one that describes the function of the software, for example, "Image organizer (Try it)" or "Photo editor (Support it)". 3. Product category and version. The same principle is also applicable to products that are released under "general" names, such as "Word processor" or "Presentation software", which should be changed to "Document authoring (Try it)" or "PowerPoint presentation creator (Support it)". 4. Product size (including pre-installation components). When adding a program of this type as a product, keep in mind that some companies "separate" the actual product with its pre-installation components. For example, they release "desktop publishing software" under a "graphical editor" name because the actual product consists of the editor and various other programs
