The programs in the CAD family range from simple drafting, measuring and modeling tools through to highly complex design solutions. Users can achieve a wide range of design tasks using a computer-aided design approach that makes use of a number of sophisticated software tools. These tools are then combined in a suite of objects that can be used to create both printed and electronic 2-D and 3-D drawings. Today's AutoCAD users can create plans for buildings, bridges, ships and tunnels as well as automobiles, furniture and other products. The programs also provide advanced functionality for industrial design and analysis.

Designers and engineers can also incorporate the results of their design calculations into a 3-D model of a physical structure.

Layered drawing In Autodesk AutoCAD Crack, each layer is a separate document that contains geometry and text. Each layer can be given a layer style (texturing, color, linetype, gradient) that applies to all of the geometry contained in that layer. Multiple layers can be combined in a single drawing file, and each layer has a visibility flag that indicates whether it is visible or not. In addition to standard layers, there are several kinds of layers that AutoCAD provides for use in the creation of complex drawings. For example, there is a group layer. A group layer is made up of one or more view layers, so that all the objects contained in each view layer are grouped together. You can also set up rule layers for rule-based layer properties. Rule layers are also called view layers in the upper-right corner of the Layer Properties window. For complex drawings, you can create multi-view drawings, which includes any combination of general, profile, and ortho views. You can also create a B-rep layer, which is a boundary representation (tracing) layer. In that case, the drawings must be boundary based (BCB or 'BEAR') drawings. To use boundary-based tracing (BBR), you first draw the B-rep, then enter the BBR and BDM commands. The B-rep, however, is automatically converted to a boundary representation layer, if necessary, because it is based on the B-rep command. A boundary representation layer can be viewed in any view, and each layer in the layer stack has its own properties (geometry, texturing, linetype, and color) based on the geometry contained in the layer. A boundary representation layer can be used in the following ways: A surface can be created by converting a boundary representation layer into a surface layer. A surface layer can be viewed in any view and has properties that are based on the geometry that makes up the surface. A surface layer can also be used to create a subdivision surface. In addition, a boundary representation layer can be displayed in the Render tab in the views. When a boundary representation layer is displayed in the Render tab, you can create shading effects by using the Surface Shading property, which is set to a surface shader. New in AutoCAD 2016, is the use of Coordinated Drawing Views, which includes the creation of standard and non-

Storytelling is a powerful tool. It has the power to create understanding and change as well as memories and stories. It is a powerful communication medium. Not just verbal, but visual. You may have seen: Children's artwork Diagrams to explain scientific concepts Maps and diagrams Diagrams or illustrations to accompany text You may have seen something to illustrate an important idea, a joke or a point you wish to make to your audience. Use of illustrations can be one of the most powerful forms of communication. These could be as simple as an image of an architect's sketch or a diagram to illustrate a process or a system. These can have immediate impact. But how do you know whether an illustration is 'right' for the message you want to communicate? How to decide whether or not to use illustrations There are two simple questions that you need to ask yourself: What is the message you want to communicate? This is going to be the most important question to ask because it defines the context of the illustration. How am I going to illustrate this message? This second question is going to be more important than the first. If you are designing a poster, flyer or a PowerPoint presentation you need to ask the question: what will I illustrate? What is the story I want to tell? If you are trying to persuade, your question may be: why should people do what I want them to do? If you are writing a narrative or a poem you may ask yourself: how does this rhyme? What does it evoke? What does it make me feel? If you are explaining an important idea, the first question to ask is: how can I illustrate this idea? What will I illustrate? What does it look like? Now that you have answered that first question, you need to ask yourself a few more questions about your illustration: What is the content of the
